Abstract

An ideal \(I\) is a family of subsets of positive integers \(\mathbb{N}\) which is closed under taking finite unions and subsets of its elements. In this paper we introduce some lacunary ideal convergent double interval valued number sequence spaces defined by Orlicz function and study different properties of these spaces like completeness, solidity, etc. We establish some inclusion relations among them. Also we introduce the concept of ideal double lacunary convergence for interval numbers and study some basic properties of this notion.

Keywords: Completeness, \(\theta\)-convergence, ideal-convergence, lacunary sequence, interval numbers, Orlicz function.

2010 Mathematical Subject Classification: 40C05, 40J05, 46A45.
1 Background

The notion of $I$-convergence was initially introduced by Kostyrko, et. al [11] as a generalization of statistical convergence (see [8], [22]) which is based on the structure of the ideal $I$ of subset of natural numbers $\mathbb{N}$. Kostyrko, et. al [12] gave some of basic properties of $I$-convergence and dealt with extremal $I$-limit points. Although an ideal is defined as a hereditary and additive family of subsets of a non-empty arbitrary set $X$, here in our study it suffices to take $I$ as a family of subsets of $\mathbb{N}$, positive integers, i.e. $I \subset 2^\mathbb{N}$, such that $A \cup B \in I$ for each $A, B \in I$, and each subset of an element of $I$ is an element of $I$.

A non-empty family of sets $F \subset 2^\mathbb{N}$ is a filter on $\mathbb{N}$ if and only if $\emptyset \not\in F$, $A \cap B \in F$ for each $A, B \in F$, and any subset of an element of $F$ is in $F$. An ideal $I$ is called non-trivial if $I \neq \emptyset$ and $\mathbb{N} \notin I$. Clearly $I$ is a non-trivial ideal if and only if $F = F(I) = \{\mathbb{N} - A : A \in I\}$ is a filter in $\mathbb{N}$, called the filter associated with the ideal $I$. A non-trivial ideal $I$ is called admissible if and only if $\{\{n\} : n \in \mathbb{N}\} \subset I$. A non-trivial ideal $I$ is called maximal if there cannot exist any non-trivial ideal $J \neq I$ containing $I$ as a subset. Further details on ideals can be found in Kostyrko, et.al (see [11]). Recall that a sequence $x = (x_k)$ of points in $\mathbb{R}$ is said to be $I$-convergent to a real number $\ell$ if $\{k \in \mathbb{N} : |x_k - \ell| \geq \varepsilon\} \in I$ for every $\varepsilon > 0$ ([11]). In this case we write $I - \lim x_k = \ell$. Further details on ideal convergence can be found in [21], [26]. The notion of $I$-convergence double sequence was initially introduced by Tripathy and Tripathy (see [25]).

Interval arithmetic was first suggested by Dwyer [2] in 1951. Development of interval arithmetic as a formal system and evidence of its value as a computational device was provided by Moore [15] in 1959 and Moore and Yang [16] in 1962. Further works on interval numbers can be found in Dwyer [3], Fischer [9], Markov [14]. Furthermore, Moore and Yang [17], have developed applications to differential equations.

Chiao in [1] introduced sequence of interval numbers and defined usual convergence of sequences of interval number. Şengül and Eryılmaz in [23] introduced and studied bounded and convergent sequence spaces of interval numbers and showed that these spaces are complete metric space. Esi in [4], [5] and Esi and Esi [29], [30], Esi and Catalbas [31] introduced and studied strongly almost $\lambda$-convergence and statistically almost $\lambda$-convergence of interval numbers and lacunary sequence spaces of interval numbers, respectively. In [6], Esi and Hazarika introduced the difference classes of interval numbers. Recently Esi [7] has studied double sequences of interval numbers.

2 Preliminary Results

We denote the set of all real valued closed intervals by $I\mathbb{R}$. Any elements of $I\mathbb{R}$ is called closed interval and denoted by $I$. That is $I = \{x \in \mathbb{R} : a \leq x \leq b\}$. An
interval number \( \mathfrak{x} \) is a closed subset of real numbers \([1]\). Let \( x_1 \) and \( x_r \) be first and last points of \( \mathfrak{x} \) interval number, respectively. For \( \mathfrak{x}_1, \mathfrak{x}_2 \in \mathbb{IR} \), we have \( \mathfrak{x}_1 = \mathfrak{x}_2 \iff x_1 = x_2, x_r = x_2 \), \( \mathfrak{x}_1 + \mathfrak{x}_2 = \{ x \in \mathbb{R} : x_1 + x_2 \leq x \leq x_1 + x_2 \} \), and if \( \alpha \geq 0 \), then \( \alpha \mathfrak{x} = \{ x \in \mathbb{R} : \alpha x_1 \leq x \leq \alpha x_1 \} \) and if \( \alpha < 0 \), then \( \alpha \mathfrak{x} = \{ x \in \mathbb{R} : \alpha x_1 \leq x \leq \alpha x_1 \} \),

\[
\mathfrak{x}_1 \mathfrak{x}_2 = \{ x \in \mathbb{R} : \min \{ x_1, x_2, x_1, x_2, x_1, x_2 \} \leq x \leq \max \{ x_1, x_2, x_1, x_2, x_1, x_2 \} \}.
\]

In \([15]\), Moore proved that the set of all interval numbers \( \mathbb{IR} \) is a complete metric space with a metric \( d \) defined by

\[
d(\mathfrak{x}_1, \mathfrak{x}_2) = \max \{ |x_1 - x_2|, |x_1 - x_2| \}.
\]

In the special case \( \mathfrak{x}_1 = [a, a] \) and \( \mathfrak{x}_2 = [b, b] \), we obtain usual metric of \( \mathbb{R} \).

The algebraic properties of \( \mathbb{IR} \) can be found in \([1]\).

Now we give the definition of convergence of interval numbers:

**Definition 2.1** \(([1])\) A sequence \( \mathfrak{x} = (\mathfrak{x}_k) \) of interval numbers is said to be convergent to the interval number \( \mathfrak{x}_o \) if for each \( \varepsilon > 0 \) there exists a positive integer \( k_o \) such that \( d(\mathfrak{x}_k, \mathfrak{x}_o) < \varepsilon \) for all \( k \geq k_o \). We write \( \lim_k \mathfrak{x}_k = \mathfrak{x}_o \) to denote that \( \mathfrak{x}_o \) is the limit of a sequence \( \mathfrak{x} = (\mathfrak{x}_k) \).

Thus, \( \lim_k \mathfrak{x}_k = \mathfrak{x}_o \iff \lim_k x_{ki} = x_o \) and \( \lim_k x_{ki} = x_o \).

An interval valued double sequence \( \mathfrak{x} = (\mathfrak{x}_{k,l}) = (\mathfrak{x}_{k,l}) \) is said to be convergent in the Pringsheim’s sense or \( P \)-convergent to an interval number \( \mathfrak{x}_o \), if for every \( \varepsilon > 0 \), there exists \( N \in \mathbb{N} \) such that

\[
d(\mathfrak{x}_{k,l}, \mathfrak{x}_o) < \varepsilon \quad \text{for} \quad k, l > N
\]

(see \([19]\)) and we denote it by \( P - \lim \mathfrak{x}_{k,l} = \mathfrak{x}_o \), where \( d(\mathfrak{x}_{k,l}, \mathfrak{y}_{k,l}) \) is the Hausdorff distance between \( \mathfrak{x} = (\mathfrak{x}_{k,l}) \) and \( \mathfrak{y} = (\mathfrak{y}_{k,l}) \) (see \([28]\)). The interval number \( \mathfrak{x}_o \) is called the Pringsheim limit of \( \mathfrak{x} = (\mathfrak{x}_{k,l}) \). More exactly, we say that a double sequence of interval numbers \( \mathfrak{x} = (\mathfrak{x}_{k,l}) \) converges to a finite interval number \( \mathfrak{x}_o \) if \( \mathfrak{x}_{k,l} \) tends to \( \mathfrak{x}_o \) as both \( k \) and \( l \) tend to infinity independently of each another. We denote by \( \mathbb{IR}^2 \) the set of all double convergent interval numbers of double interval numbers.

The interval number double sequence \( \mathfrak{x} = (\mathfrak{x}_{k,l}) \) is bounded if and only if there exists a positive number \( B \) such that \( d(\mathfrak{x}_{k,l}, \mathfrak{0}) < B \) for all \( k \) and \( l \). We shall denote all bounded interval number double sequences by \( \mathbb{IR}_\infty^2 \). Let \( \mathbb{IR}^2 \) denote the set of all double sequences of interval numbers.

Recall in \([18]\), \([13]\) that an Orlicz function \( M \) is a continuous, convex, nondecreasing function define for \( x \geq 0 \) such that \( M(0) = 0 \) and \( M(x) > 0 \) for
If convexity of Orlicz function is replaced by \( M(x + y) \leq M(x) + M(y) \) then this function is called the modulus function and characterized by Ruckle [20]. An Orlicz function \( M \) is said to satisfy \( \Delta_2 \)–condition for all values \( u \), if there exists \( K > 0 \) such that \( M(2u) \leq KM(u) \), \( u \geq 0 \). Subsequently, the notion of Orlicz function was used to defined sequence spaces by Tripathy et.al [24], Tripathy and Hazarika [27] and many others.

**Definition 2.2** ([10]) A lacunary sequence is an increasing integer sequence \( \theta = (k_r) \) such that \( k_0 = 0 \) and \( h_r = k_r - k_{r-1} \rightarrow \infty \). The intervals determined by \( \theta \) will be defined by \( J_r = (k_{r-1}, k_r] \) and the ratio \( \frac{k_r}{k_{r-1}} \) will be defined by \( \phi_r \).

Freedman et.al., [10] defined the space \( N_\theta \) in the following way. For any lacunary sequence \( \theta = (k_r) \),

\[
N_\theta = \left\{ (x_k) : \lim_{r \to \infty} \frac{1}{h_r} \sum_{k \in J_r} |x_k - L| = 0, \text{ for some } L \right\}.
\]

The space \( N_\theta \) is a \( BK \)-space with the norm

\[
||(x_k)||_\theta = \sup_r \frac{1}{h_r} \sum_{k \in J_r} |x_k|.
\]

\( N_\theta^0 \) denote the subset of these sequences in \( N_\theta \) for which \( L = 0 \), \( (N_\theta^0, ||.||_\theta) \) is also a \( BK \)-space.

Let \( \theta_1 \) and \( \theta_2 \) be any two lacunary sequences and \( J_r = \{k : k_{r-1} < k \leq k_r\} \), \( J_s = \{l : l_{s-1} < l \leq l_s\} \). \( h_{r,s} = h_r h_s \) and \( k_0 = 0 \), \( h_r = k_r - k_{r-1} \rightarrow \infty \) as \( r \rightarrow \infty \); \( l_0 = 0 \), \( h_s = l_s - l_{s-1} \rightarrow \infty \) as \( s \rightarrow \infty \). Also we defined \( \theta = (h_{r,s}) \) and \( J_{rs} = J_r \times J_s \).

Let \( p = (p_{i,j}) \) be a double sequence of positive real numbers. If \( 0 < p_{i,j} \leq \sup_{i,j} p_{i,j} = H < \infty \) and \( D = \max\left(1, 2^{H-1}\right) \), then for \( a_{i,j}, b_{i,j} \in \mathbb{R} \) for all \( i, j \in \mathbb{N} \), we have

\[
|a_{i,j} + b_{i,j}|^{p_{i,j}} \leq D \left(|a_{i,j}|^{p_{i,j}} + |b_{i,j}|^{p_{i,j}}\right).
\]

**3 Main Results**

We define the generalized double lacunary mean by

\[
t_{rs}(x) = \frac{1}{h_{r,s}} \sum_{(k,l) \in J_{rs}} x_{k,l}.
\]

In this paper, we define new double sequence spaces for interval sequences as follows.
Let $I$ be an admissible ideal of $\mathbb{N} \times \mathbb{N}$. Let $M$ be an Orlicz function and $p = (p_{i,j})$ be a double sequence of strictly positive real numbers. We introduce the following sequence spaces:

$$2\overline{w}^I(\vartheta, M, p) = \left\{ \overline{x} = (\overline{x}_{i,j}) : \left( r, s \right) \in \mathbb{N} \times \mathbb{N} : \frac{1}{h_{r,s}} \sum_{(i,j) \in J_{rs}} M \left( \frac{d(\overline{x}_{i,j}, \overline{x}_o)}{\rho} \right) \right\} \in I,$$

for some $\rho > 0$, and $\overline{x}_o \in \mathbb{R}$,

$$2\overline{w}^o(\vartheta, M, p) = \left\{ \overline{x} = (\overline{x}_{i,j}) : \left( r, s \right) \in \mathbb{N} \times \mathbb{N} : \frac{1}{h_{r,s}} \sum_{(i,j) \in J_{rs}} M \left( \frac{d(\overline{x}_{i,j}, \overline{0})}{\rho} \right) \right\} \in I,$$

for some $\rho > 0$,

$$2\overline{w}^\infty(\vartheta, M, p) = \left\{ \overline{x} = (\overline{x}_{i,j}) : \exists K > 0 \text{ s.t.} \left( r, s \right) \in \mathbb{N} \times \mathbb{N} : \frac{1}{h_{r,s}} \sum_{(i,j) \in J_{rs}} M \left( \frac{d(\overline{x}_{i,j}, \overline{0})}{\rho} \right) \right\} \in I,$$

for some $\rho > 0$,

and

$$2\overline{w}^\infty(\overline{0}, M, p) = \left\{ \overline{x} = (\overline{x}_{i,j}) : \sup_{r,s} \frac{1}{h_{r,s}} \sum_{(i,j) \in J_{rs}} M \left( \frac{d(\overline{x}_{i,j}, \overline{0})}{\rho} \right) < \infty, \right\} \in I,$$

for some $\rho > 0$,

where $d(\overline{x}_{i,j}, \overline{y}_{i,j})$ is the Hausdorff distance between $\overline{x} = (\overline{x}_{i,j})$ and $\overline{y} = (\overline{y}_{i,j})$.

**Theorem 3.1** Let $p = (p_{i,j})$ be bounded and $r, s \in \mathbb{N}$. The double sequence spaces $2\overline{w}^I(\vartheta, M, p)$, $2\overline{w}^o(\vartheta, M, p)$, $2\overline{w}^\infty(\vartheta, M, p)$ and $2\overline{w}^\infty(\overline{0}, M, p)$ are complete metric spaces defined by

$$g(\overline{x}, \overline{y}) = \inf \left\{ \frac{\rho_{r,s}}{\rho} : \left( \sup_{r,s} \frac{1}{h_{r,s}} \sum_{(i,j) \in J_{rs}} M \left( \frac{d(\overline{x}_{i,j}, \overline{y}_{i,j})}{\rho} \right) \right) ^{p_{r,s}} \leq 1, \text{ for some } \rho > 0 \right\}$$

where $H = \max \{ 1, \sup_{r,s} p_{r,s} < \infty \}$.
Proof. It can be easily verified that the classes are metric spaces. To prove completeness the class $\overline{w}_\infty(\theta, M, p)$, let $(\xi_{i,j}^s)$ be a Cauchy sequence in $\overline{w}_\infty(\theta, M, p)$. Then $g((\xi_{i,j}^s) - (\xi_{i,j}^t)) \rightarrow 0$ as $s, t \rightarrow \infty$. For given $\varepsilon > 0$, choose $a > 0$ and $x_0 > 0$ be such that $\frac{\varepsilon}{ax_0} > 0$ and $M\left(\frac{ax_0}{2}\right) \geq 1$. Now $g((\xi_{i,j}^s) - (\xi_{i,j}^t)) \rightarrow 0$ as $s, t \rightarrow \infty$ implies that there exists $n_o \in \mathbb{N}$ such that $g((\xi_{i,j}^s) - (\xi_{i,j}^t)) < \frac{\varepsilon}{ax_0}$ for all $s, t \geq n_o$. Then

$$\inf \left\{ \rho^{\frac{p_{i,j}}{\Pi}} : \left( \sup_{r,s} \frac{1}{h_{r,s}} \sum_{(i,j) \in J_{rs}} \left[ M\left( \frac{d((\xi_{i,j}^s - \xi_{i,j}^t, \overline{u})}{\rho} \right) \right]^{p_{i,j}} \right)^{\frac{1}{\Pi}} \leq 1, \right.$$ for some $\rho > 0 \left\} < \frac{\varepsilon}{ax_0}$,

where $H$ is the same as in Theorem 3.1. Now from (3.1), we have

$$M\left( \frac{d((\xi_{i,j}^s - \xi_{i,j}^t, \overline{u})}{\rho} \right) \leq 1 \leq M\left( \frac{ax_0}{2} \right).$$

Therefore

$$\frac{d((\xi_{i,j}^s - \xi_{i,j}^t, \overline{u})}{g((\xi_{i,j}^s) - (\xi_{i,j}^t)) < \frac{ax_0}{2} \cdot \frac{\varepsilon}{ax_0} = \frac{\varepsilon}{2}.$$

This implies that $(\xi_{i,j}^s)$ is a Cauchy sequence of interval numbers. So it is convergent, let $\lim_{s \rightarrow \infty} \xi_{i,j}^s = \xi_{i,j}$. Using continuity of $M$, we have

$$\lim_{t \rightarrow \infty} \left( \sup_{r,s} \frac{1}{h_{r,s}} \sum_{(i,j) \in J_{rs}} \left[ M\left( \frac{d((\xi_{i,j}^s - \xi_{i,j}^t, \overline{u})}{\rho} \right) \right]^{p_{i,j}} \right)^{\frac{1}{\Pi}} \leq 1$$

and then

$$\left( \sup_{r,s} \frac{1}{h_{r,s}} \sum_{(i,j) \in J_{rs}} \left[ M\left( \frac{d((\xi_{i,j}^s - \xi_{i,j}^t, \overline{u})}{\rho} \right) \right]^{p_{i,j}} \right)^{\frac{1}{\Pi}} \leq 1.$$

Let $s \geq n_o$, then taking infimum of such $\rho'$s we obtain $g((\xi_{i,j}^s - \xi_{i,j}^t)) < \varepsilon$. Now using $g((\xi_{i,j} - \overline{u}) \leq g((\xi_{i,j} - \xi_{i,j}^s) + g((\xi_{i,j}^s) - \overline{u})$, we get $(\xi_{i,j}) \in \overline{w}_\infty (\theta, M, p)$. Hence $\overline{w}_\infty (\theta, M, p)$ is complete. This completes the proof. \blacksquare

Theorem 3.2 (a) $\overline{w}_\infty (\theta, M, p) \subset \overline{w}_\infty (\theta, M, p)$, (b) $\overline{w}_o (\theta, M, p) \subset \overline{w}_\infty (\theta, M, p)$.

Proof. It is easy, so omitted. \blacksquare
Theorem 3.3 (a) If \(0 < \inf_{i,j} p_{i,j} \leq p_{i,j} < 1\), then \(2\overline{w}^T(\bar{\theta}, M, p) \subset 2\overline{w}^T(\bar{\theta}, M)\).

(b) If \(1 < p_{i,j} < \sup_{i,j} p_{i,j} < \infty\), then \(2\overline{w}^T(\bar{\theta}, M) \subset 2\overline{w}^T(\bar{\theta}, M, p)\).

(c) If \(0 < p_{i,j} \leq q_{i,j} < \infty\) and \(\frac{q_{i,j}}{p_{i,j}}\) is bounded, then \(2\overline{w}^T(\bar{\theta}, M, p) \subset 2\overline{w}^T(\bar{\theta}, M, q)\).

Proof. The first part of the result follows from the relation

\[
\left\{ (r, s) \in \mathbb{N} \times \mathbb{N} : \frac{1}{h_{r,s}} \sum_{(i,j) \in J_{rs}} M \left( \frac{d(\bar{x}_{i,j}, \bar{x}_o)}{\rho} \right) \geq \varepsilon \right\}
\]

and the second part of the result follows from the relation

\[
\left\{ (r, s) \in \mathbb{N} \times \mathbb{N} : \frac{1}{h_{r,s}} \sum_{(i,j) \in J_{rs}} \left[ M \left( \frac{d(\bar{x}_{i,j}, \bar{x}_o)}{\rho} \right) \right]^{p_{i,j}} \geq \varepsilon \right\}
\]

This completes the proof. The proof of the part three is easy, so omitted. ■

Theorem 3.5 Let \(M_1\) and \(M_2\) be two Orlicz functions. Then

\(2\overline{w}^T(\bar{\theta}, M_1, p) \cap 2\overline{w}^T(\bar{\theta}, M_2, p) \subset 2\overline{w}^T(\bar{\theta}, M_1 + M_2, p)\).

Proof. Let \((\bar{x}_{i,j}) \in 2\overline{w}^T(\bar{\theta}, M_1, p) \cap 2\overline{w}^T(\bar{\theta}, M_2, p)\). Then for every \(\varepsilon > 0\) we have

\[
\left\{ (r, s) \in \mathbb{N} \times \mathbb{N} : \frac{1}{h_{r,s}} \sum_{(i,j) \in J_{rs}} \left[ M_1 \left( \frac{d(\bar{x}_{i,j}, \bar{x}_o)}{\rho_1} \right) \right]^{p_{i,j}} \geq \varepsilon \right\} \in \mathcal{I}, \text{ for some } \rho_1 > 0
\]

and

\[
\left\{ (r, s) \in \mathbb{N} \times \mathbb{N} : \frac{1}{h_{r,s}} \sum_{(i,j) \in J_{rs}} \left[ M_2 \left( \frac{d(\bar{x}_{i,j}, \bar{x}_o)}{\rho_2} \right) \right]^{p_{i,j}} \geq \varepsilon \right\} \in \mathcal{I}, \text{ for some } \rho_2 > 0
\]
Let $\rho = \max \{ \rho_1, \rho_2 \}$. The result follows from the following inequality

$$
\sum_{(i,j) \in J_{rs}} \left[ (M_1 + M_2) \left( \frac{d(x_{i,j}, x_o)}{\rho} \right) \right]^{p_{i,j}} \leq D \left( \sum_{(i,j) \in J_{rs}} \left[ M_1 \left( \frac{d(x_{i,j}, x_o)}{\rho} \right) \right]^{p_{i,j}} + \sum_{(i,j) \in J_{rs}} \left[ M_2 \left( \frac{d(x_{i,j}, x_o)}{\rho} \right) \right]^{p_{i,j}} \right).
$$

This completes the proof.

**Theorem 3.6** Let $M_1$ and $M_2$ be two Orlicz functions. Then

$$
2\overline{w}^T (\bar{\theta}, M_1, p) \subset 2\overline{w}^T (\bar{\theta}, M_2 \circ M_1, p).
$$

**Proof.** Let $\inf p_{i,j} = H_0$. For given $\varepsilon > 0$, we first choose $\varepsilon_0 > 0$ such that $\max \{ \varepsilon_0^H, \varepsilon_0^{H_0} \} < \varepsilon$. Now using the continuity of $M_2$ choose $0 < \delta < 1$ such that $0 < t < \delta$ implies $M_2(t) < \varepsilon_0$. Let $(\bar{x}_{i,j}) \in 2\overline{w}^T (\bar{\theta}, M_1, p)$. Now from the definition of $2\overline{w}^T (\bar{\theta}, M_1, p)$, for some $\rho > 0$

$$
A(\delta) = \left\{ (r, s) \in \mathbb{N} \times \mathbb{N} : \frac{1}{h_{r,s}} \sum_{(i,j) \in J_{rs}} \left[ M_1 \left( \frac{d(x_{i,j}, x_o)}{\rho} \right) \right]^{p_{i,j}} \geq \delta^H \right\} \in \mathcal{I}.
$$

Thus if $(r, s) \notin A(\delta)$ then we have

$$
\frac{1}{h_{r,s}} \sum_{(i,j) \in J_{rs}} \left[ M_1 \left( \frac{d(x_{i,j}, x_o)}{\rho} \right) \right]^{p_{i,j}} < \delta^H
$$

$$
\Rightarrow \sum_{(i,j) \in J_{rs}} \left[ M_1 \left( \frac{d(x_{i,j}, x_o)}{\rho} \right) \right]^{p_{i,j}} < h_{r,s} \delta^H
$$

$$
\Rightarrow M_1 \left( \frac{d(x_{i,j}, x_o)}{\rho} \right) < \delta, \text{ for all } i, j = 1, 2, 3, \ldots
$$

Hence from above inequality and using continuity of $M_2$, we must have

$$
M_2 \left( M_1 \left( \frac{d(x_{i,j}, x_o)}{\rho} \right) \right) < \varepsilon_0, \text{ for all } i, j = 1, 2, 3, \ldots
$$

which consequently implies that

$$
\sum_{(i,j) \in J_{rs}} \left[ M_2 \left( M_1 \left( \frac{d(x_{i,j}, x_o)}{\rho} \right) \right) \right]^{p_{i,j}} < h_{r,s} \max \{ \varepsilon_0^H, \varepsilon_0^{H_0} \} < h_{r,s} \varepsilon.
$$
Some Lacunary Ideal Convergence of Interval Numbers ...

So,
\[
\frac{1}{h_{rs}} \sum_{(i,j) \in J_{rs}} \left[ M_2 \left( M_1 \left( \frac{d(x_{i,j}, x_0)}{\rho} \right) \right) \right]^{p_{i,j}} < \varepsilon.
\]
This shows that
\[
\left\{ (r,s) \in \mathbb{N} \times \mathbb{N} : \frac{1}{h_{rs}} \sum_{(i,j) \in J_{rs}} \left[ M_2 \left( M_1 \left( \frac{d(x_{i,j}, x_0)}{\rho} \right) \right) \right]^{p_{i,j}} \geq \varepsilon \right\} \subset A(\delta)
\]
and so belongs to \( I \). This completes the proof. \( \blacksquare \)

**Theorem 3.7** Let \( M_1 \) and \( M_2 \) be two Orlicz functions. Then (a) \( 2\overline{w}_0^\infty (\overline{\theta}, M_1, p) \cap 2\overline{w}_0^\infty (\overline{\theta}, M_2, p) \subset 2\overline{w}_0^\infty (\overline{\theta}, M_1 + M_2, p) \); (b) \( 2\overline{w}_0^\infty (\overline{\theta}, M_1, p) \subset 2\overline{w}_0^\infty (\overline{\theta}, M_2 \circ M_1, p) \).

The proof of the theorem follows from the Theorems 3.5 and 3.6.

**Theorem 3.8** Let \( M_1 \) and \( M_2 \) be two Orlicz functions satisfying \( \Delta_2 \)-condition. If \( \beta = \lim_{t \to \infty} \frac{M_2(t)}{t} \geq 1 \), then (a) \( 2\overline{w}_0^\infty (\overline{\theta}, M_1, p) = 2\overline{w}_0^\infty (\overline{\theta}, M_2 \circ M_1, p) \), (b) \( 2\overline{w}_0^\infty (\overline{\theta}, M_1, p) = 2\overline{w}_0^\infty (\overline{\theta}, M_2 \circ M_1, p) \).

**Proof.** It is easy, so omitted. \( \blacksquare \)

The following Theorem is a direct consequence of definition of equivalent mapping.

**Theorem 3.9** Let \( M_1 \) and \( M_2 \) be two Orlicz functions such that \( M_1 \approx M_2 \). Then \( Z(\overline{\theta}, M_1, p) = Z(\overline{\theta}, M_2, p) \), for \( Z = 2\overline{w}_0^\infty, 2\overline{w}_0^\infty, 2\overline{w}_0^\infty, 2\overline{w}_0^\infty \).

Let \( w \) denotes be the all sequences real or complex numbers. A sequence space \( E \) is said to be solid (or normal) if \( (x_k) \in E \) and for all sequence \( (\alpha_k) \) of scalars with \(|\alpha_k| \leq 1\), for all \( k \in \mathbb{N} \) implies \((\alpha_k x_k) \in E \).

Let \( K = \{ k_1 < k_2 < \cdots \} \subseteq \mathbb{N} \) and \( E \) be a sequence space. A \( K \)-step space of \( E \) is a sequence space \( \lambda_K^E = \{ (x_{k_n}) : (k_n) \in E \} \).

A canonical preimage of a sequence \( (x_{k_n}) \in \lambda_K^E \) is a sequence \( (y_n) \in w \) defined as
\[
y_n = \begin{cases} x_n, & \text{if } n \in \mathbb{N}; \\ 0, & \text{otherwise} \end{cases}
\]
A canonical preimage of a step space \( \lambda_K^E \) is a set of canonical preimages of all elements in \( \lambda_K^E \), i.e. \( y \) is in canonical preimage of \( \lambda_K^E \) if and only if \( y \) is canonical preimage of some \( x \in \lambda_K^E \).

A sequence space \( E \) is said to be monotone if it contains the canonical preimages of its step spaces.

**Lemma 3.10** Every normal space is monotone.
Theorem 3.11 The double sequence space $\overline{w}^2(\overline{\theta}, M, p)$, $\overline{w}_o^2(\overline{\theta}, M, p)$, $\overline{w}_\infty^2(\overline{\theta}, M, p)$ and $\overline{w}_\infty(\overline{\theta}, M, p)$ are solid as well as monotone.

Proof. We give the proof for only $\overline{w}_o^2(\overline{\theta}, M, p)$. The others can be proved similarly. Let $x = (x_{i,j}) \in \overline{w}_o^2(\overline{\theta}, M, p)$ and $(\alpha_{i,j})$ be a scalar sequence such that $|\alpha_{i,j}| \leq 1$ for all $i, j \in \mathbb{N}$. Then for every $\varepsilon > 0$ we have

$$
\left\{(r, s) \in \mathbb{N} \times \mathbb{N} : \frac{1}{h_{r,s}} \sum_{(i,j) \in J_{rs}} \left[ M \left( \frac{d(\alpha_{i,j}x_{i,j}, 0)}{\rho} \right) \right]^{p_{i,j}} \geq \varepsilon \right\} \subseteq \left\{(r, s) \in \mathbb{N} \times \mathbb{N} : \frac{E}{h_{r,s}} \sum_{(i,j) \in J_{rs}} \left[ M \left( \frac{d(\alpha_{i,j}x_{i,j}, 0)}{\rho} \right) \right]^{p_{i,j}} \geq \varepsilon \right\} \in \mathcal{I},
$$

where $E = \max\{1, |\alpha_{k,l}|^H\}$. Hence $(\alpha x) \in \overline{w}_o^2(\overline{\theta}, M, p)$. By Lemma 3.10, the double sequence space $\overline{w}_o^2(\overline{\theta}, M, p)$ is monotone. This completes the proof.

4 $\mathcal{I}_\overline{\theta}$-convergence of Interval Numbers

Definition 4.1 A double sequence $\overline{x} = (\overline{x}_{i,j})$ of interval numbers is said to be $\overline{\theta}$-convergent to $\overline{x}_0 \in \mathbb{IR}$ if for every $\varepsilon > 0$, there exists a positive integer $N$ such that

$$d(t_{rs}(\overline{x}), \overline{x}_0) < \varepsilon \text{ for all } r, s > N.$$ 

Definition 4.2 A double sequence $\overline{x} = (\overline{x}_{i,j})$ of interval numbers is said to be $\mathcal{I}_\overline{\theta}$-convergent to $\overline{x}_0 \in \mathbb{IR}$ if for every $\varepsilon > 0$, the set

$$K_\varepsilon(\overline{\theta}) = \{ (r, s) \in \mathbb{N} \times \mathbb{N} : d(t_{rs}(\overline{x}), \overline{x}_0) \geq \varepsilon \} \in \mathcal{I},$$

or equivalently

$$\{ (r, s) \in \mathbb{N} \times \mathbb{N} : d(t_{rs}(\overline{x}), \overline{x}_0) < \varepsilon \} \in F(\mathcal{I}).$$

In this case we write $\mathcal{I}_\overline{\theta} - \lim \overline{x} = \overline{x}_0$.

Theorem 4.3 Let $\overline{x} = (\overline{x}_{i,j})$ be a double sequence in $\mathbb{IR}$. If $\overline{\theta} - \lim \overline{x} = \overline{x}_0$, then $\mathcal{I}_\overline{\theta} - \lim \overline{x} = \overline{x}_0$.

Proof. Let $\overline{\theta} - \lim \overline{x} = \overline{x}_0$, then for every $\varepsilon > 0$, there exists $N \in \mathbb{N}$ such that

$$d(t_{rs}(\overline{x}), \overline{x}_0) < \varepsilon, \text{ for all } r, s > N.$$ 

Therefore the set

$$B = \{ (r, s) \in \mathbb{N} : d(t_{rs}(\overline{x}), \overline{x}_0) \geq \varepsilon \} \subseteq \{ (1, 1), (2, 2), \ldots, (N - 1, N - 1) \}.$$ 

But, $\mathcal{I}$ being admissible, we have $B \in \mathcal{I}$. Hence $\mathcal{I}_\overline{\theta} - \lim \overline{x} = \overline{x}_0$. □
Theorem 4.4  Sequential method $I_θ$ is regular.

Proof. The proof follows from the fact that $I$ is admissible and Theorem 4.3.

5 Open Problem

We introduce some lacunary ideal convergent double interval valued number sequence spaces defined by Orlicz function and study different properties of these spaces like completeness, solidity, some inclusion relations among them and also we introduced the concept of ideal double lacunary convergence for interval numbers and studied some basic properties of this notion. It is open problem that these classes have similar properties in three-dimensional space or not.
